

Here are the **simplest and most common ways** to copy a list in Python.
These are beginner-friendly and work in all programs.

✓ 1. Using `copy()` (Recommended for simple lists)

```
1 a = [1, 2, 3]
2 b = a.copy()
3
4 print(b)    # [1, 2, 3]
```

- Makes a **shallow copy** (good for normal/flat lists).
-

✓ 2. Using slicing `[:]`

```
1 a = [10, 20, 30]
2 b = a[:]
3
4 print(b)    # [10, 20, 30]
```

- Also a **shallow copy**.
 - Very fast and commonly used.
-

✓ 3. Using `list()` constructor

```
1 a = [5, 6, 7]
2 b = list(a)
3
4 print(b)    # [5, 6, 7]
```

✓ 4. For nested lists → use deep copy

If your list contains other lists inside it, use deep copy:

```
1 import copy
2
3 a = [1, [2, 3]]
```

```
4 b = copy.deepcopy(a)
5
6 print(b)    # [1, [2, 3]]
```

Deep copy ensures **inner lists are also copied**, not shared.

⚡ Summary (Super Simple)

Method	Best Use
a.copy()	Normal list
a[:]	Very simple & fast
list(a)	Another simple option
copy.deepcopy(a)	Nested lists
